# Outline

---

- MATLAB Data Types

Logical, Char, Numeric, Cell Array, Structures

- MATLAB Files

M-files, MAT-files, Text Data files

- Data Input and Output

Input/Output Display, High Level Input/Output, Low Level Input/Output

# MATLAB Data Types

- **Logical Data**

In MATLAB, the logical data type represents a logical **true** or **false** state using the numbers **1** and **0**, respectively. Some MATLAB functions and operators return logical true or false to indicate whether a certain condition is found to be true or not. Each logical variable takes 8 bits in storage.

## Examples

```
>>[30 40 50 60 70] > 40  
ans =  
    0    0    1    1    1
```

```
>>ischar('5')  
ans = 1  
>>ischar(5)  
ans = 0
```

isreal, iscell, isstruct  
isinteger, isnumeric,  
isfloat, islogical,  
isfield,

# MATLAB Data Types

- **Characters and Strings**

MATLAB represents each Unicode character internally as its corresponding numeric value. Each character takes 16 bits in storage. A string is an array of characters.

## Examples

```
>>double('AB')
```

```
ans = 65 66
```

```
>> char(65,66)'
```

```
ans = AB
```

```
>>strcat('1', '-', '2')
```

```
ans = 1-2
```

```
>>strvcat('1', '-', '2')
```

```
ans =  $\frac{1}{2}$ 
```

```
strcmp
```

```
strmatch
```

```
strfind
```

# MATLAB Data Types

- **Numeric Data:** Integers and Floating Point Numbers

## --Integers

int8, uint8; int16, uint16; int32, uint32; int64, uint64

Range of Values:

Signed  $[-2^{N-1}, 2^{N-1} - 1]$  ; Unsigned  $[0, 2^N - 1]$

## Examples

```
>>intmax('int8')
```

```
ans =
```

```
127
```

```
>>intmin('int8')
```

```
ans =
```

```
-128
```

```
>>intmax('uint8')
```

```
ans =
```

```
255
```

# MATLAB Data Types

- **Numeric Data:** Integers and Floating Point Numbers

- **Floating Point Numbers**

- Double-precision (default), 64 bits**  $[-1.79769 \times 10^{308}, 1.79769 \times 10^{308}]$

- 63 Sign (0 = positive, 1 = negative)

- 62 to 52 Exponent, biased by 1023

- 51 to 0 Fraction f of the number 1.f

- Single-precision, 32 bits**  $[-3.40282 \times 10^{38}, 3.40282 \times 10^{38}]$

- 31 Sign (0 = positive, 1 = negative)

- 30 to 23 Exponent, biased by 127

- 22 to 0 Fraction f of the number 1.f

realmax

realmin

# MATLAB Data Types

- **Numeric Types:** Integers and Floating Point Numbers

- **Floating Point Numbers:** **Data accuracy**

Because of the finite number of bits available for floating point numbers, on any computer, there is a small gap between each number and the next larger number. The size of this gap limits the precision of your results. You can use the **eps** function to determine a numbers accuracy.

## Examples

```
>>eps(double(pi))
```

```
ans =
```

```
4.4409e-016
```

```
>>eps(single(pi))
```

```
ans =
```

```
2.3842e-007
```

```
>>eps(5)
```

```
ans =
```

```
8.8818e-016
```

```
>>eps(50)
```

```
ans =
```

```
7.1054e-015
```

# MATLAB Data Types

- Cell Array**

A cell array provides a storage mechanism for dissimilar kinds of data. You can store arrays of different types and sizes within the cells of a cell array.

Example

```
>>cell{1,1}=[1 2 3; 4 5 6; 7 8 9];
```

```
>>x=cell{1,1}(2,1)
```

ans =

4

cell{1,1}	cell{1,2}	cell{1,3}												
<table border="1"><tr><td>1 2 3</td></tr><tr><td>2 4 6</td></tr><tr><td>3 6 9</td></tr></table>	1 2 3	2 4 6	3 6 9	<table border="1"><tr><td>'John Smith'</td></tr><tr><td>'9/12/94'</td></tr><tr><td>'Class'</td></tr><tr><td>'Obs.1'</td></tr><tr><td>'Obs.2'</td></tr></table>	'John Smith'	'9/12/94'	'Class'	'Obs.1'	'Obs.2'	<table border="1"><tr><td>0.1+2i</td><td>5-4.6i</td></tr><tr><td>23+7i</td><td>-2-9.5i</td></tr></table>	0.1+2i	5-4.6i	23+7i	-2-9.5i
1 2 3														
2 4 6														
3 6 9														
'John Smith'														
'9/12/94'														
'Class'														
'Obs.1'														
'Obs.2'														
0.1+2i	5-4.6i													
23+7i	-2-9.5i													
cell{2,1}	cell{2,2}	cell{2,3}												
<table border="1"><tr><td>1.2 2.5 -5.7 13.4</td></tr></table>	1.2 2.5 -5.7 13.4	<table border="1"><tr><td>-5 2</td></tr><tr><td>8 -4</td></tr><tr><td>9 -6</td></tr></table>	-5 2	8 -4	9 -6	<table border="1"><tr><td>'text'</td><td>1 2</td></tr><tr><td></td><td>2 4</td></tr><tr><td>2.1 3.5 0</td><td>11+i</td></tr></table>	'text'	1 2		2 4	2.1 3.5 0	11+i		
1.2 2.5 -5.7 13.4														
-5 2														
8 -4														
9 -6														
'text'	1 2													
	2 4													
2.1 3.5 0	11+i													

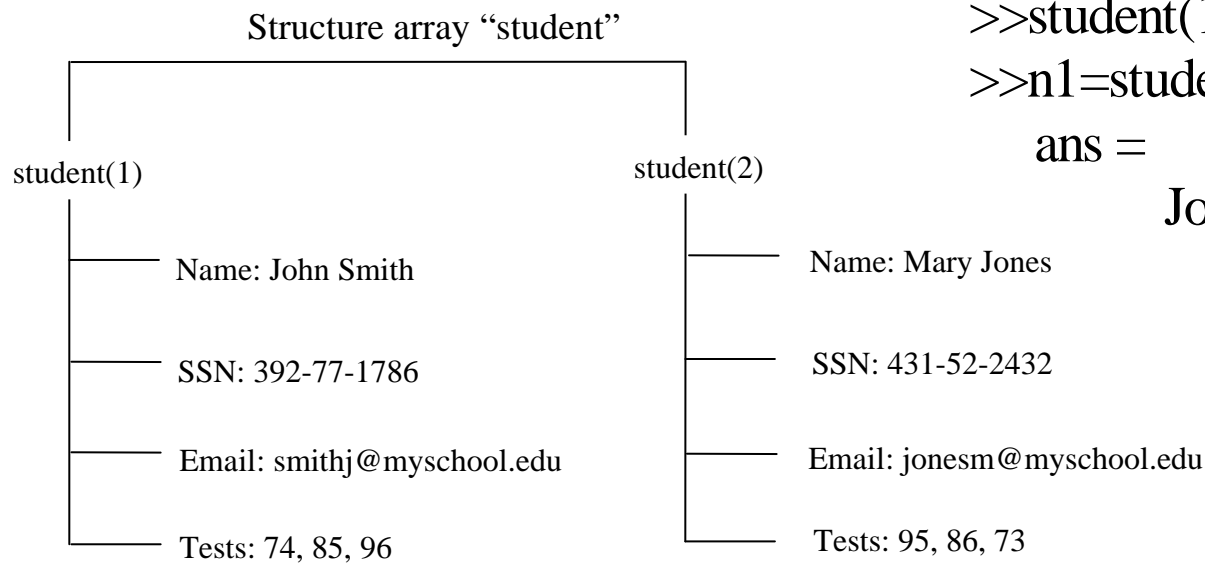

# MATLAB Data Types

- **Structures**

Structures are MATLAB arrays with named fields. The fields of a structure can contain any kind of data.

```
>>student(1).name= 'John Smith';  
>>n1=student(1).name  
ans =  
    John Smith
```

# MATLAB Files

---

- **M-files:** filename.m

M-files are ASCII files written in MATLAB language. M-file names must start with an alphabetic character, may contain any alphanumeric characters or underscores, and must be no longer than 63 characters.

## --MATLAB Scripts

- . Are a bunch of commands or steps you need to perform many times.
- . Do not accept input arguments or return output arguments.
- . Store variables in the Workspace that is shared with other scripts and with the MATLAB command line interface.

## --MATLAB Functions

- . Can accept input arguments and return output arguments.
- . Store variables in a workspace internal to the function.

# MATLAB Files

- **An Example of M-files**

```
function f = fact (n)      ← Function definition line
% Compute a factorial value. ← H1 line
% FACT(N) returns the factorial of N, ← Help text
% usually denoted by N!

% Put simply, FACT(N) is PROD(1:N). ← Comment
f = prod(1:n);           ← Function body
```

# MATLAB Files

---

- **MAT-files:** filename.mat
  - MAT-files are the format MATLAB uses for saving variable names and values created during a MATLAB session. They are in binary format to achieve a compact storage.
  - MAT-files provide a convenient way for MATLAB to import and export data, or to move data between different MATLAB applications.

# MATLAB Files

- **Text Data Files**

- Text data files are in ASCII format.
- Text data files can be numeric, alphabetic or mixed.

text header line

row header

Class Grades for Spring Term			
	Grade1	Grad 2	Grade 3
John	85	86	87
Ann	79	80	81
Rob	90	92	94

row header

space delimiter

# Data Input and Output

- **Input/Output Display**

Command	Description
<code>disp(A)</code>	Displays an array, without printing the array name
<code>disp('text')</code>	Displays the text string enclosed within the single quotes
<code>Sprintf (format, Data)</code>	Write formatted data to string
<code>x=input ('prompt')</code>	Request user input a numerical value
<code>x=input ('prompt','s')</code>	Request user input a string
<code>k=menu('title', 'option 1', 'option 2', ..., 'option n')</code>	Generate menu of choices for user input
<code>Format</code>	Set display format for output

# Data Input and Output

- **Input/Output Display**

Command	Description	Example
<code>format short</code>	Four decimal digits(Default)	3.1416
<code>format long</code>	16 digits (14 decimals for double, 7 decimals for single)	3.14159265358979
<code>format short e</code>	Scientific notation with 5 digits(four decimal digits)	3.1416e+000
<code>format long e</code>	Scientific notation with 16 digits (15 decimals for double, 7 decimals for single)	3.141592653589793e+000
<code>format short g</code>	Best of fixed or floating point, with 5 digits	3.1416
<code>format long g</code>	Best of fixed or floating point, with 15 digits for double; 7 digits for single	3.14159265358979
<code>format short eng</code>	Engineering format. Four decimals and a power that is a multiple of three	3.1416e+000
<code>format long eng</code>	Engineering format. 15 digits for double, 7 digits for single, and a power that is a multiple of three	3.14159265358979e+000
<code>format hex</code>	Hexadecimal	400921fb54442d18
<code>format bank</code>	Two decimal digits for monetary calculations	3.14
<code>format +</code>	Positive, negative, or zero	+
<code>format rat</code>	Rational approximation	355/113
<code>format compact</code>	Compact display mode	
<code>format loose</code>	Loose display mode	

# Data Input and Output

- **Input/Output Display** -- Examples:  
>>A = input('Please enter the value of A: ')  
  
>>menu('Choose a color','Red','Green','Blue')

# Data Input and Output

---

- **High Level Input/Output**

- Using MATLAB Import Wizard

- Example 1: import an ASCII data file;

- Example 2: import a MAT-file file;

- Example 3: import an Excel spreadsheet data file;

# Data Input and Output

---

- **High Level Input/Output**

--Using MATLAB functions

load	↔	save	most useful
csvread	↔	csvwrite	files with comma as delimiter
dlmread	↔	dlmwrite	identify delimiter
xlsread	↔	xlswrite	Microsoft Excel spreadsheets
wk1read	↔	wk1write	Lotus 1-2-3 spreadsheets

# Data Input and Output

---

- **High Level Input/Output**

--Using MATLAB functions

load

load filename

load filename X Y Z ...

save

save('filename')

save('filename', 'var1', 'var2', ...)

save('...', 'format')

## Examples

# Data Input and Output

---

- **Low Level Input/Output**

--Using MATLAB functions

`fclose` Close one or more open files

`feof` Test for end-of-file

`ferror` Query MATLAB about errors in file input or output

`fgetl` Return next line of file as string without line terminator(s)

`fgets` Return next line of file as string with line terminator(s)

`fopen` Open file or obtain information about open files

`fprintf` Write formatted data to file

`fread` Read binary data from file

`frewind` Rewind open file

`fscanf` Read formatted data from file

`fseek` Set file position indicator

`ftell` Get file position indicator

`fwrite` Write binary data to file
